NMAP RECON LAB

By Laurel

Date: 15th Oct, 2026

Tools Used:

Kali Linux terminal

ifconfig (to check my local network information. For reference only, no screenshots included)

Nslookup (to map domain names to their IP addresses. For reference only, no screenshots included)

Nmap

Nano (to create and edit the host file)

OBJECTIVE

To learn how to identify a target's IP address using ns lookup then performing some port scans on the targets using Nmap

STEPS I FOLLOWED:

STEP 1: IP Address Lookup using nslookup

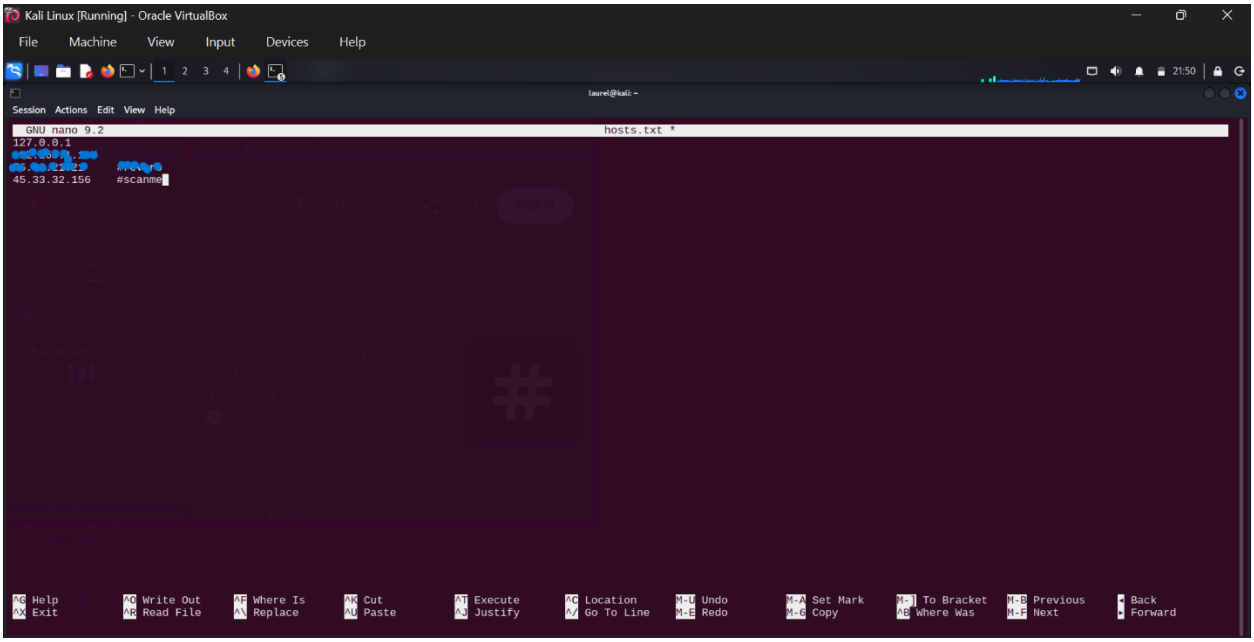

I used nslookup to resolve the domains I wanted to scan to their IP addresses. This is the first step to get valid targets

Command used: nslookup scanme.nmap.org (for privacy, no screenshot included)

STEP 2: Created the Host file

After getting the IPs, I created a file name *hosts.txt* using **nano.** This file contains all the targets I want to scan.

Command used: nano *hosts.txt*

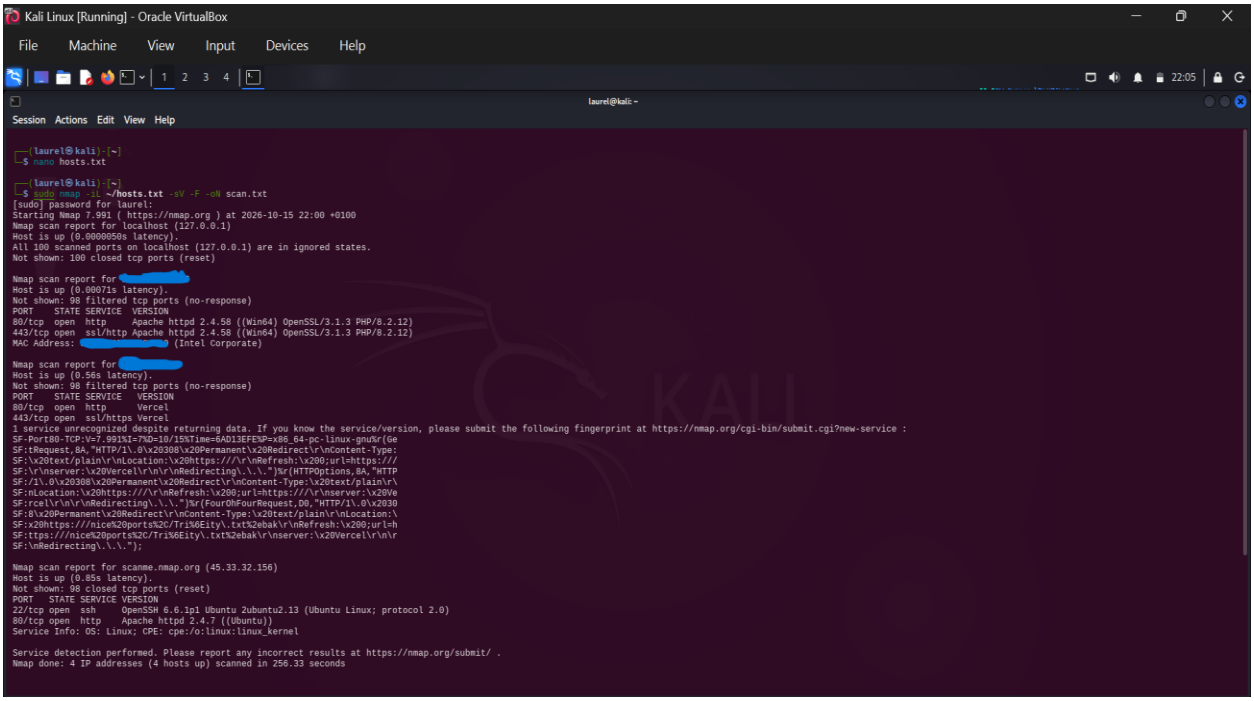

(Some ip addresses withheld for privacy)

STEP 3: Performed the Scan from File

I used nmap to scan all hosts from the file. I used -sV for version and -oN to save.

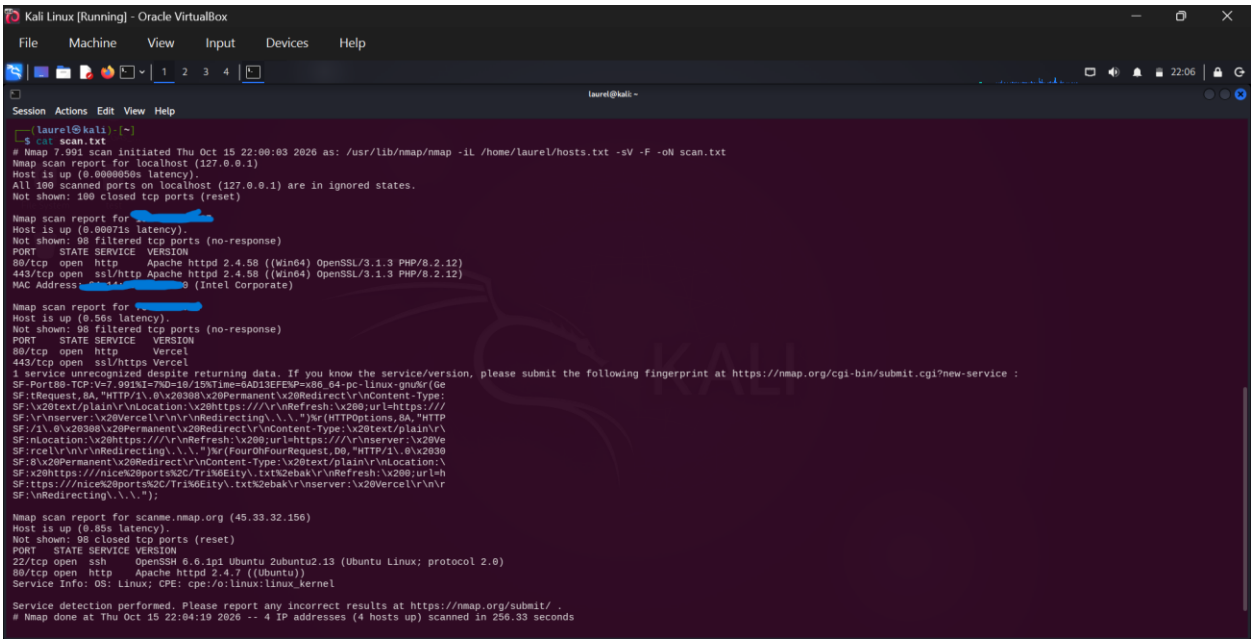

Command used: sudo nmap -iL ~/hosts.txt -sV -F -oN scan.txt

STEP 4: Viewed the Saved Output

I viewed the saved result to confirm the scan worked.

Command used: cat scan.txt

Kali Linux [Running] - Oracle VirtualBox
